How SEWER Backups occur A SEWER back up is simply really a foul odor and often a foul taste. While you may think no foul consequence, additional water is generally flowing in the sewer and has an effect on the environment. A bursting boiler in your home may create lukewarm sanitary water discharge. If you sense the sewer clog has actually left you with a bad odor, you should stop right away and get in touch with a reliable pl

Is this some sort of hacking tool? Or is the download made by the website? Or maybe that file is actually hosted with the website itself and is used just for that purpose? A: This is the result of a

denial of service attack, where a sufficiently large number of request come from a single IP. This result in a high amount of traffic and most likely an inconvenience for many users. From Wikipedia In computer security, a denial-of-service (DoS) attack or Distributed DoS (DDoS) is a technique for forcing a system or service to limit its ability to perform its intended function, or to stop functioning entirely. A do-not-reply email would be an example of this. When this attack is successful it can also have effects beyond system load. It can also possibly result in the website being shut down entirely.

This attack is typically done with bots, software or a network of computers that send out a large number of requests at an IP address. A: I believe this is a deliberate attack, most likely directed against the website. Typically they would do so by sending a lot of requests at the site's web server, as you would if you were trying to take over their website. A: This looks like a way to flood a website with requests. This causes a lot of hassle (usually for the visitor) and could even put the site out of action for a while. Q: Coordinate Invariance in Quantum Mechanics In classical mechanics, the Hamiltonian is said to be coordinate invariant due to the fact that it is a function of the product of mass and position coordinates. Can someone explain in detail what coordinate invariance means in quantum mechanics? A: I'll use the scalar potential $V(x)$ which is normally assumed to be a function of the position x and the momentum p as the coordinate of the particle. In Schrödinger's equation, the Hamiltonian $H = \frac{p^2}{2m} + V(x)$ is, by definition, coordinate-independent. The potential $V(x)$ is then very special in quantum mechanics and has a very specific physical meaning: It is the potential the particle experiences at each point x in spacetime. It is a function of the particle's wave function ψ
